2010 ASIST, Pittsburgh, USA

Talk Outline

- Introduction to Linked Data
- Linked Data and ISO Topic Maps
- Linked Data and ISO Identifiers
- Essential Features of OWL2

Introduction to Linked Data

Graham Moore, NetworkPlanet

The Web is changing...

From publishing HTML created for consumption by people to DATA for the consumption by machines

Linked Data: Key Principle 1

URLs are the names of things

For People, products, events, THINGS, any thing.

http://www.networkedplanet.com/people/gra

http://www.networkedplanet.com/products/webplatform

http://www.networkedplanet.com/company/networkedplanet

Linked Data: Key Principle 2

- URLs resolve to 'Linked Data' representations in the form of RDF/XML

@prefix person: <http://www.networkedplanet.com/people/>

@prefix company: <http://www.networkedplanet.com/company/>

@prefix model: <http://www.networkedplanet.com/model/>

person:gra model:worksfor company:networkedplanet .

person:gra foaf:friend person:kal .

The data returned is 'something that will be possibly of interest'

Linked Data: Key Principle 3

The data returned contains links to other data on the web

prefix @np “http://www.networkedplanet.com/”

np:people/gra np:def/worksfor np:company/networkedplanet

=> http://www.networkedplanet.com/company/networkedplanet

Dereferencing URIs

- Best practice is to deliver an HTML page for humans to understand the 'thing' and representations for machines using RDF/XML

Modelling

- One of the biggest challenges of Linked Data is deciding what data to expose and what 'model' to define

A model / schema / ontology defines what kind of data will be exposed.

E.g. Person, works-for, Company, has-product, Product

Modelling

Linked Data is only about exposing data and not updating it.

Therefore, the process is about choosing how to expose the raw data

URI Reuse

- It's important to try and use existing identifiers
- Mostly in terms of types and properties of models
- But also links between data set entities

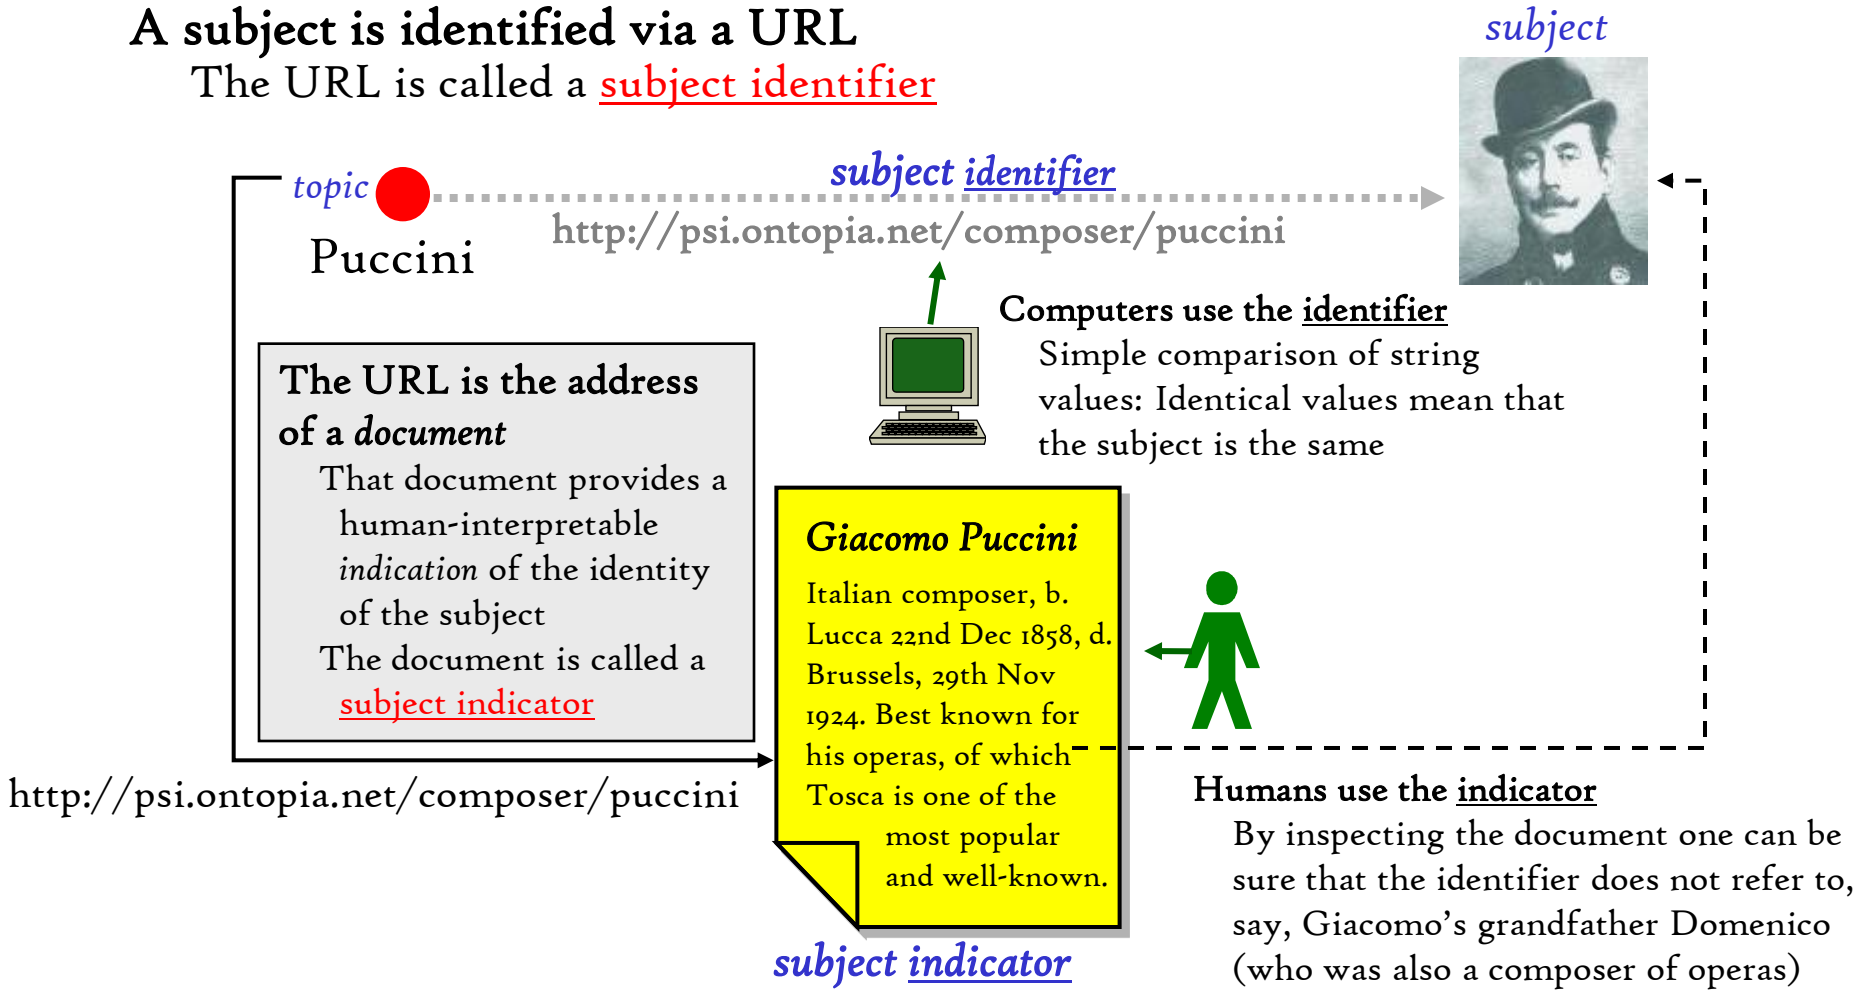
Linked Data &
ISO JTC1/SC34 (WG3: Topic Maps)

Subject Identifier and Subject Indicator

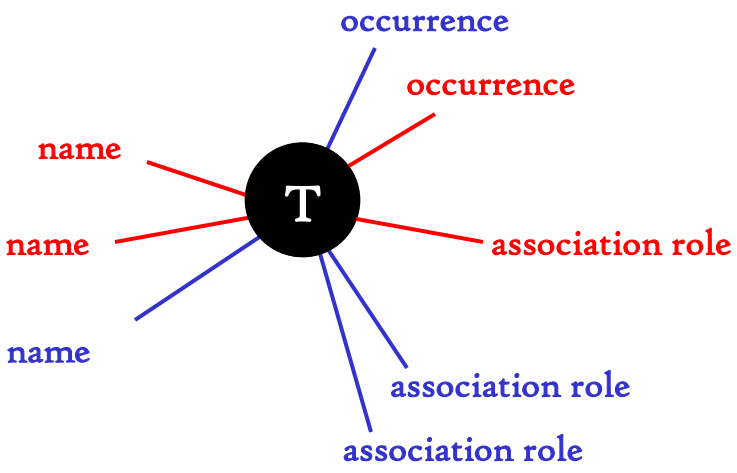
A subject is identified via a URL

The URL is called a subject identifier



Principles of merging in Topic Maps

- **In Topic Maps, every topic represents some subject**
- **The collocation objective requires exactly one topic per subject**
  - When two topic maps are merged, topics that represent the same subject should be merged to a single topic
  - When two topics are merged, the resulting topic has the union of the characteristics of the two original topics



...and the resulting topic has the union of the original characteristics

Linked Data & ISO Identifiers

ISO TC46/SC9

(Identification and Description)

ISO 2018: International Standard(IS) Book Number

- The ISBN is the identification system for each product form or edition of a monographic publication published or produced by a specific publisher.
- The ISBN is applicable to monographic publications (or their individual sections or chapters where these are made separately available) and certain types of related products that are available to the public.

ISO 3297: IS Serial Number

- The ISSN is a standard code for the unique identification of serials and other continuing resources.
- The ISSN provides a unique identifier for a specific serial or other continuing resource in a defined medium.
- The ISSN describes a mechanism, the "linking ISSN (ISSN-L)" that provides for collocation or linking among the different media versions of the same continuing resource.

ISO 21047: IS Text Code

- The ISTC provides the efficient identification of textual works.
- The ISTC provides a means of uniquely and persistently identifying textual works in information systems and of facilitating the exchange of information about those works between authors, agents, publishers, retailers, libraries, rights administrators and other interested parties, on an international level.

ISO 3901: IS Recording Code

- The ISRC defines and promotes the use of a standard code for the unique identification of recordings.
- The ISRC may be applied to audio recordings and music video recordings regardless of whether they are in analogue or digital formats.
- The ISRC shall not be used for the numbering of audio or audiovisual carriers (e.g. compact discs or videocassettes).
- Audiovisual recordings, other than music video recordings produced in conjunction with an audio recording, are excluded from the scope of the ISRC. Such audiovisual recordings should be assigned an ISAN in accordance with ISO 15706.

ISO 15707: IS Musical Work Code

- The ISWC specifies a means of uniquely identifying a musical work.
- The ISWC standardizes and promotes internationally the use of a standard identification code so that musical works can be uniquely distinguished from one another within computer databases and related documentation and for the purposes of collecting societies involved in the administration of rights to such works.
- The ISWC identifies musical works as intangible creations. It is not used to identify manifestations of or objects related to a musical work. Such manifestations and objects are the subject of separate identification systems, such as ISRC for sound recordings, ISMN for printed music, and ISAN for audiovisual works.

ISO 15706: IS Audiovisual Number

- The ISAN establishes and defines a voluntary standard numbering system for the unique and international identification of audiovisual works.
- An ISAN identifies an audiovisual work throughout its life and is intended for use wherever precise and unique identification of an audiovisual work would be desirable.
- An ISAN is applied to the audiovisual work itself. It is not related to the physical medium of such an audiovisual work, or the identification of that medium.

ISO 27729: IS Name Identifier

An example of how ISO identifiers and others can work together

ISO 27729: IS Name Identifier

- The ISNI identifies "*Public Identities used publicly by parties involved throughout the media content industries*"
- In the ISNI system, parties may be natural, legal of fictional.

ISO 27729: IS Name Identifier

Individual person (Party)

vs

Public Identity (Name)

Stefani Germanotta

Vs.

Lady Gaga

ISO 27729: IS Name Identifier

Natural Person Metadata set:

- ISNI Number
- Name
- Date of Birth
- Place of Birth
- Reference resource
- Class / Role / URI

ISO 27729: IS Name Identifier

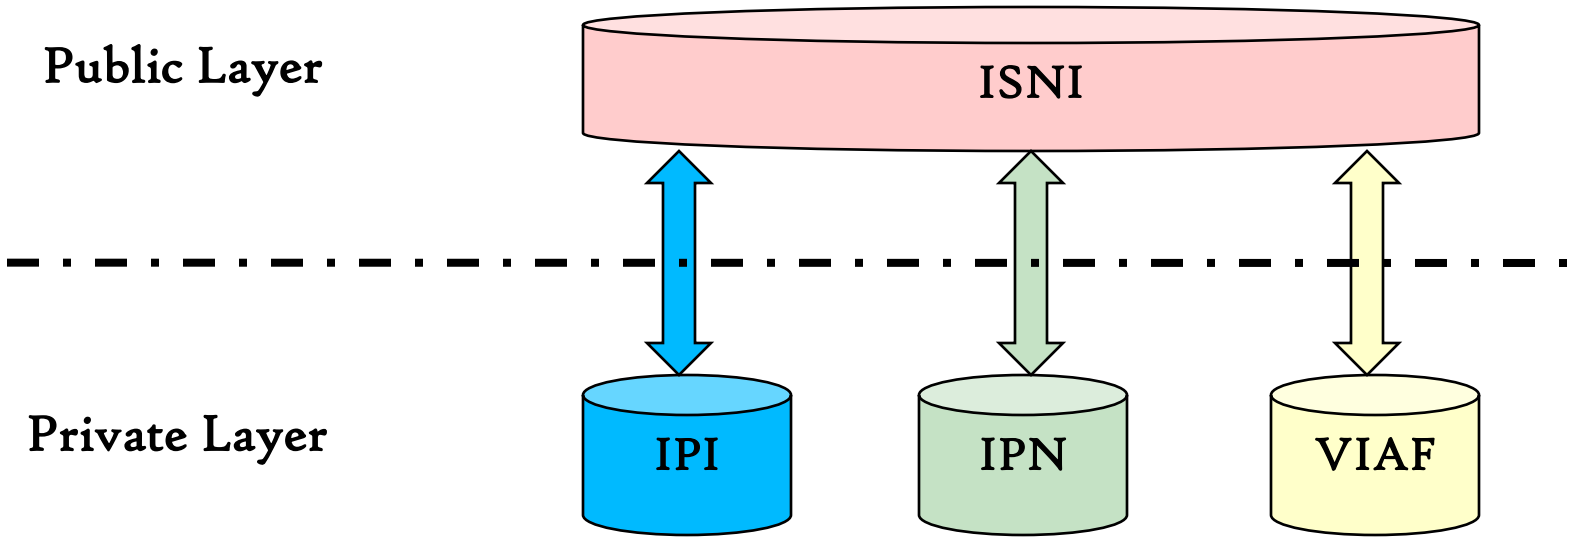
Example :

- ISNI 1234 6834 9573 0495
- Lady Gaga
- 28 March 1986
- New York, USA
- “Poker Face”
- Musical_Work / Author / www.ipi.net/isni?1236483
- Sound_Recording / Performer /www.ipda.org/isni?1236483

Technical Architecture

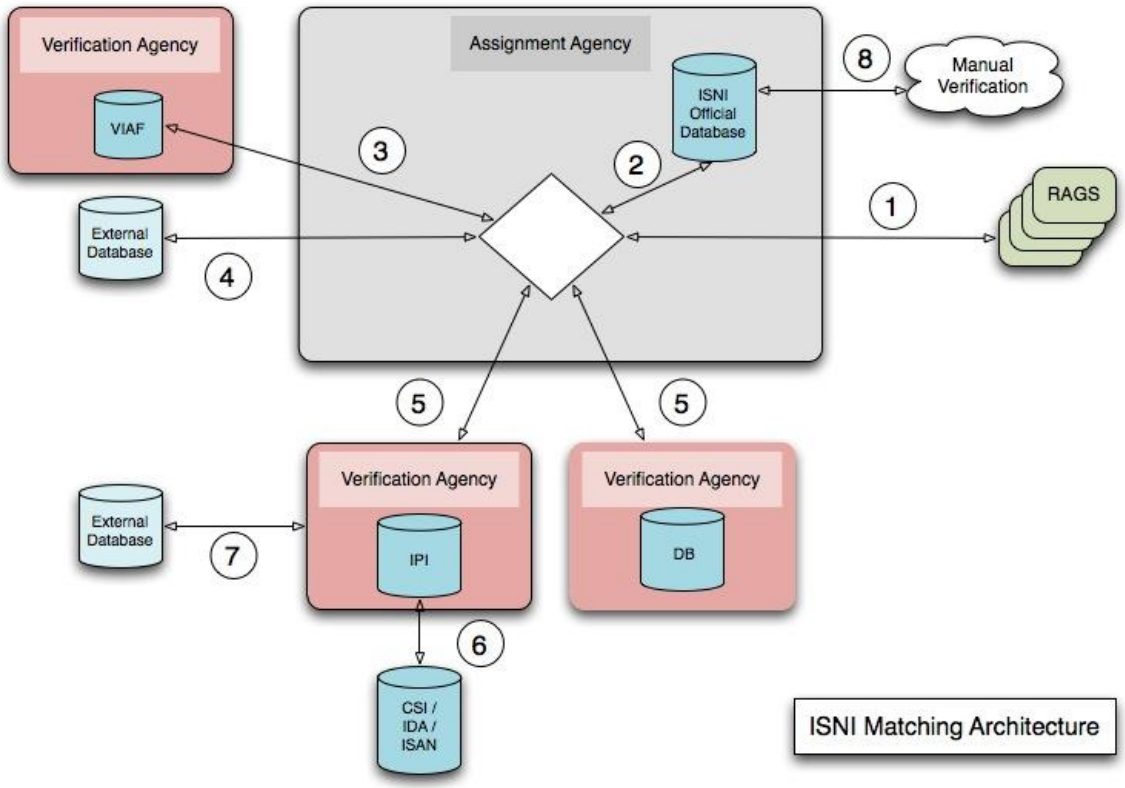
ISO 27729: IS Name Identifier

A Bridge Identifier



ISO 27729: IS Name Identifier

Technical Architecture



1. Registration Agencies
2. Central ISNI DB
3. VIAF
4. External Databases
5. Verification Agencies
6. Resources databases
7. External databases
8. Manual verifications

Technical Architecture

- **OCLC will act as the Assignment Agency**
  - Interface with Registration Agencies
  - Cross-repertoire matching
  - ISNI Numbers allocation
- **CISAC will act as a Verification Agency for:**
  - Musical Works Creators (Phase 1)
  - Audio-Visual Works Creators (phase 2)
  - Visual Arts Creators (phase 3)

International Standard Name Identifier

Initial Load

Performed by OCLC on behalf of ISNI-IA

- **Cross match of**
  - The VIAF database.
  - The IPI database.
  - The IPDA database.
  - The Bowker "Books in Print" Database.
  - The ProQuest Researcher Database.
  - The British Library / JISC Names project Database
  - The ALCS, Prolitteris and any other IFRRO members' database.

  If the same record appears in 2 databases an ISNI is assigned.

International Standard Name Identifier

WWW.ISNI.ORG

Digital Object Identifier (DOI)

- DOIs are first class identifiers which can be used in any data model.
- DOIs are Linked Data friendly, since they can be expressed as URIs

Overview: Essential Features of OWL2

Ian Horrocks
Oxford University Computing Laboratory

What is an Ontology?

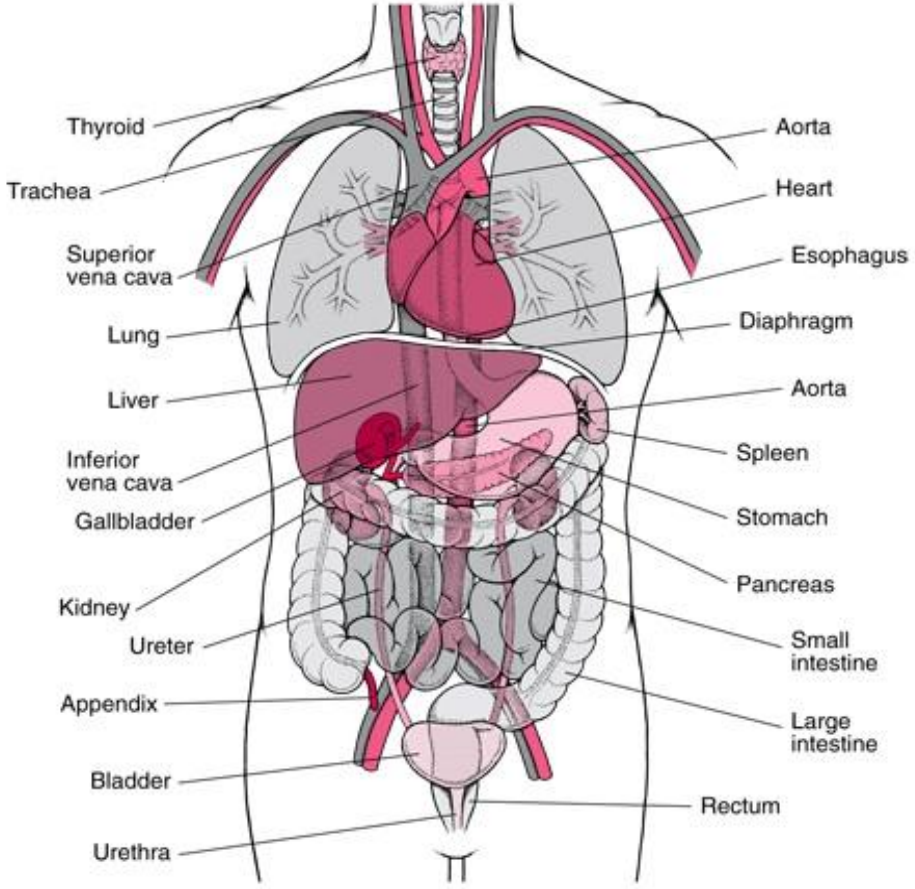
What is an Ontology?

A model of (some aspect of) the world

What is an Ontology?

A model of (some aspect of) the world

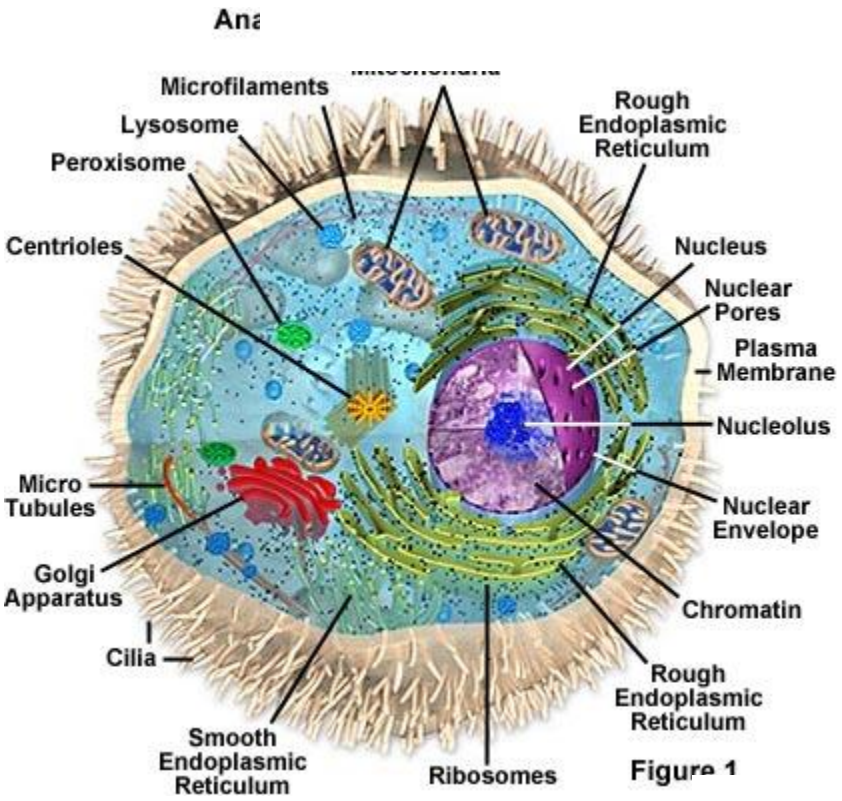
- Introduces vocabulary relevant to domain, e.g.:
  - Anatomy



What is an Ontology?

A model of (some aspect of) the world

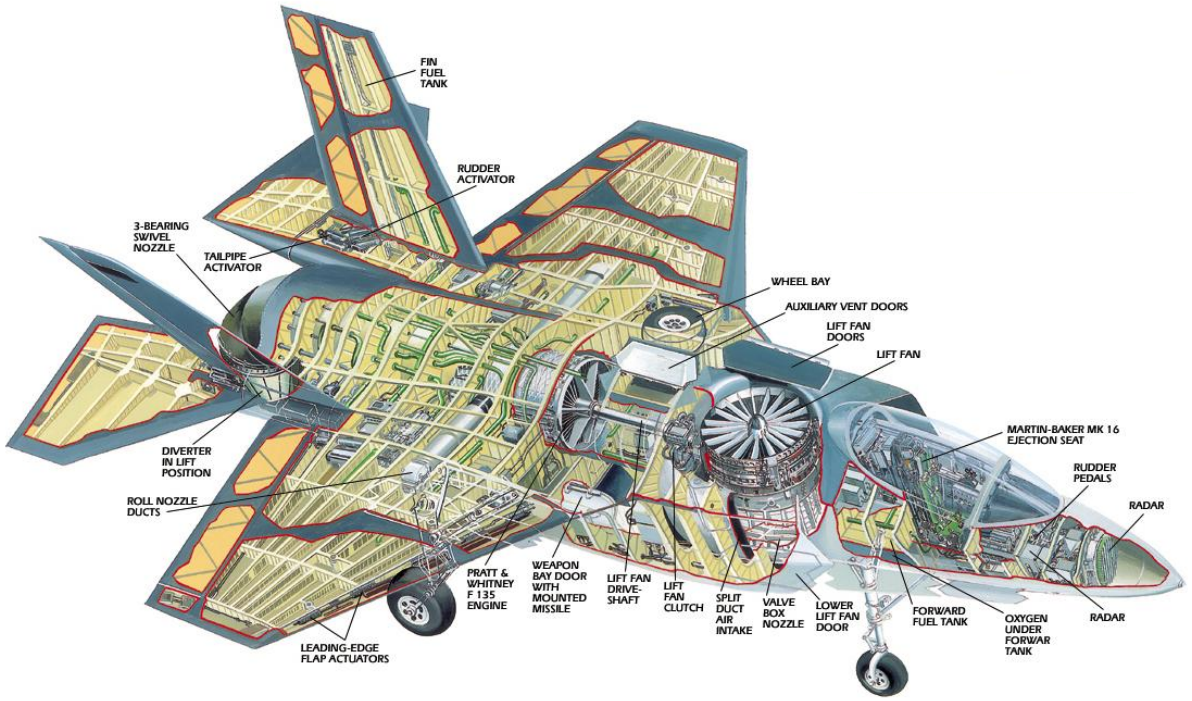
- Introduces vocabulary relevant to domain, e.g.:
  - Anatomy
  - Cellular biology



What is an Ontology?

A model of (some aspect of) the world

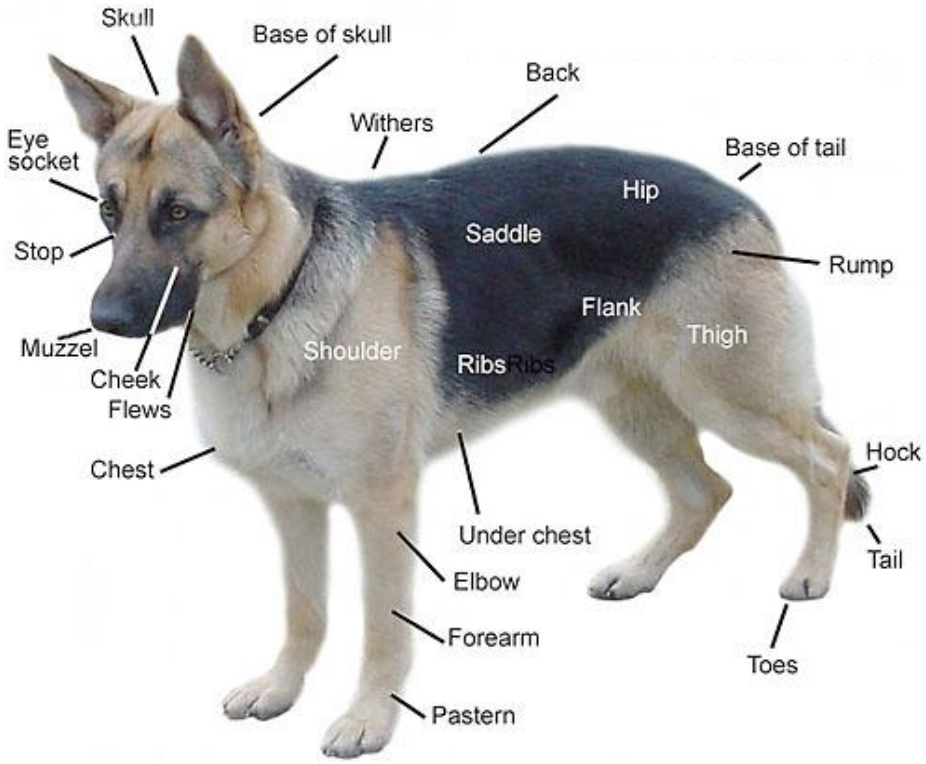
- Introduces vocabulary relevant to domain, e.g.:
  - Anatomy
  - Cellular biology
  - Aerospace



What is an Ontology?

A model of (some aspect of) the world

- Introduces vocabulary relevant to domain, e.g.:
  - Anatomy
  - Cellular biology
  - Aerospace
  - Dogs



What is an Ontology?

A model of (some aspect of) the world

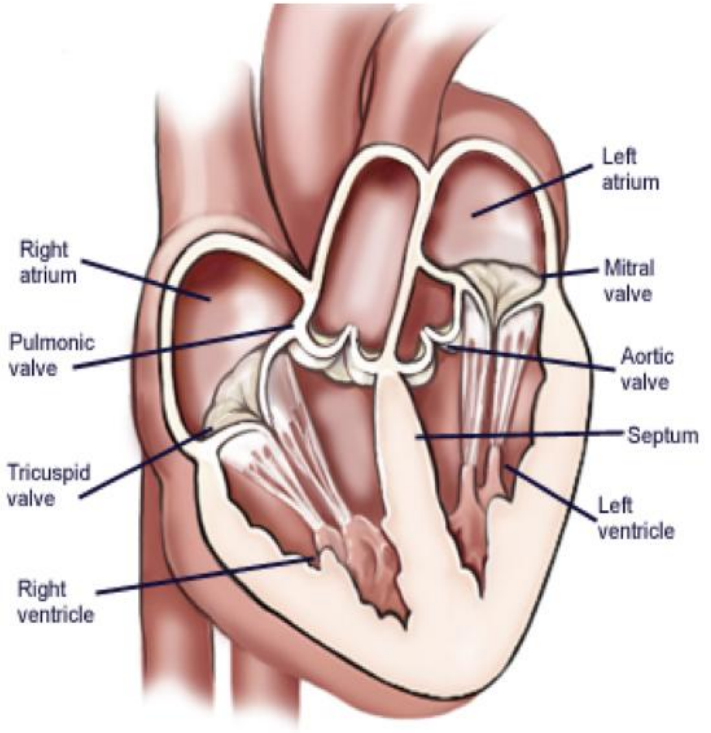
- Introduces vocabulary relevant to domain, e.g.:
  - Anatomy
  - Cellular biology
  - Aerospace
  - Dogs
  - Hotdogs
  - …

What is an Ontology?

A model of (some aspect of) the world

- Introduces vocabulary relevant to domain
- Specifies meaning of terms

  Heart is a muscular organ that is part of the circulatory system

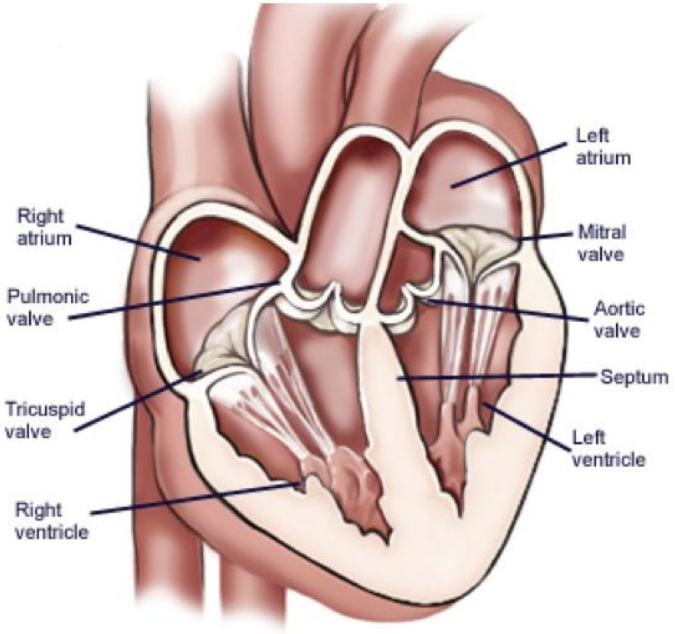


What is an Ontology?

A model of (some aspect of) the world

- Introduces vocabulary relevant to domain
- Specifies meaning of terms

  Heart is a muscular organ that is part of the circulatory system
- Formalised using suitable logic



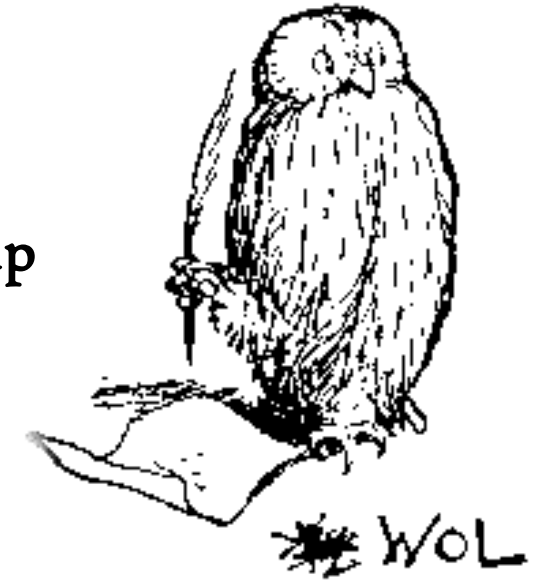
$$\forall x.[\mathsf{Heart}(x) \rightarrow \mathsf{MuscularOrgan}(x) \wedge \exists y.[\mathsf{isPartOf}(x,y) \wedge \mathsf{CirculatorySystem}(y)]]$$

The Web Ontology Language OWL

- **Motivated by Semantic Web activity**

  Add meaning to web content by annotating it with terms defined in ontologies

- **Developed by W3C WebOnt working group**
  - Based on earlier languages RDF, OIL and DAML+OIL
  - Became a **recommendation** on 10 Feb 2004



- **Supported by tools and infrastructure**
  - APIs (e.g., OWL API, Thea, OWLink)
  - Development environments (e.g., Protégé, TopBraid Composer)
  - Reasoners & Information Systems (e.g., Pellet, HermiT, Quonto)
- **Based on a Description Logic (SHOIN)**

Experience with OWL

- **OWL playing key role in increasing number & range of applications**
  - eScience, eCommerce, geography, engineering, defence, …
  - E.g., OWL tools used to identify and repair errors in a medical ontology:

    "would have led to missed test results if not corrected"
- **Experience of OWL in use has identified restrictions:**
  - on expressivity
  - on scalability

  These restrictions are problematic in some applications
- **Research has now shown how some restrictions can be overcome**

  W3C **OWL WG has updated OWL accordingly**

  Result is called OWL 2

OWL 2 in a Nutshell

- **Extends OWL with a small but useful set of features**
  - That are needed in applications
  - For which semantics and reasoning techniques are well understood
  - That tool builders are willing and able to support
- **Adds profiles**
  - Language subsets with useful computational properties
- **Is fully backwards compatible with OWL:**
  - Every OWL ontology is a valid OWL 2 ontology
  - Every OWL 2 ontology not using new features is a valid OWL ontology
- **Already supported by popular OWL tools & infrastructure:**
  - Protégé, HermiT, Pellet, FaCT++, OWL API

What's New in OWL 2?

Four kinds of new feature:

- **Increased expressive power**
  - qualified cardinality restrictions, e.g.:
    persons having two friends who are republicans
  - property chains, e.g.:
    the brother of your parent is your uncle
  - local reflexivity restrictions, e.g.:
    narcissists love themselves
  - reflexive, irreflexive, and asymmetric properties, e.g.:
    nothing can be a proper part of itself (irreflexive)
  - disjoint properties, e.g.:
    you can't be both the parent of and child of the same person
  - keys, e.g.:
    country + license plate constitute a unique identifier for vehicles

What's New in OWL 2?

Four kinds of new feature:

- Extended Datatypes

What's New in OWL 2?

Four kinds of new feature:

- **Extended Datatypes**
  - Much wider range of XSD Datatypes supported, e.g.:

    Integer, string, boolean, real, decimal, float, datatime, …

What's New in OWL 2?

Four kinds of new feature:

- **Extended Datatypes**
  - Much wider range of XSD Datatypes supported, e.g.:

    Integer, string, boolean, real, decimal, float, datatime, …
  - User-defined datatypes using facets, e.g.:

max weight of an airmail letter:
xsd:integer maxInclusive "20"^^xsd:integer

What's New in OWL 2?

Four kinds of new feature:

- **Extended Datatypes**
  - Much wider range of XSD Datatypes supported, e.g.:

    Integer, string, boolean, real, decimal, float, datatime, …
  - User-defined datatypes using facets, e.g.:

max weight of an airmail letter:
xsd:integer maxInclusive "20"^^xsd:integer

format of Italian registration plates:
xsd:string xsd:pattern "[A-Z]{2} [0-9]{3}[A-Z]{2}

What's New in OWL 2?

Four kinds of new feature:

- **Metamodelling and annotations**
  - Restricted form of metamodelling via "punning", e.g.:

    SnowLeopard subClassOf BigCat (i.e., a class)

    SnowLeopard type EndangeredSpecies (i.e., an individual)
  - Annotations of axioms as well as entities, e.g.:

    SnowLeopard type EndangeredSpecies ("source: WWF")
  - Even annotations of annotations

What's New in OWL 2?

Four kinds of new feature:

- **Syntactic sugar**
  - Disjoint unions, e.g.:

    Element is the DisjointUnion of Earth Wind Fire Water

    i.e., Element is equivalent to the union of Earth Wind Fire Water Earth Wind Fire Water are pair-wise disjoint
  - Negative assertions, e.g.:

    Mary is not a sister of Ian

    21 is not the age of Ian 

Alternative Syntaxes

- Normative exchange syntax is RDF/XML

```
<owl:Class rdf:about="#Heart">
    <owl:equivalentClass>
        <owl:Class>
            <owl:intersectionOf rdf:parseType="Collection">
                <rdf:Description rdf:about="#MuscularOrgan"/>
                <owl:Restriction>
                    <owl:onProperty rdf:resource="#isPartOf"/>
                    <owl:someValuesFrom rdf:resource="#CirculatorySystem"/>
                </owl:Restriction>
            </owl:intersectionOf>
        </owl:Class>
    </owl:equivalentClass>
    <rdfs:subClassOf rdf:resource="&owl;Thing"/>
</owl:Class>
```

Alternative Syntaxes

- Normative exchange syntax is RDF/XML
- Functional syntax mainly intended for language spec

```
EquivalentClasses(Heart
   ObjectIntersectionOf(ObjectSomeValuesFrom(isPartOf CirculatorySystem)
      MuscularOrgan))
```

Alternative Syntaxes

- Normative exchange syntax is RDF/XML
- Functional syntax mainly intended for language spec
- XML syntax for interoperability with XML toolchain

```
<EquivalentClasses>
    <Class URI="Heart"/>
    <ObjectIntersectionOf>
        <Class URI="MuscularOrgan"/>
        <ObjectSomeValuesFrom>
            <ObjectProperty URI="isPartOf"/>
            <Class URI="CirculatorySystem"/>
        </ObjectSomeValuesFrom>
    </ObjectIntersectionOf>
</EquivalentClasses>
```

Alternative Syntaxes

- Normative exchange syntax is RDF/XML
- Functional syntax mainly intended for language spec
- XML syntax for interoperability with XML toolchain
- Manchester syntax for better readability

```
Class: Heart
EquivalentTo: MuscularOrgan
              that isPartOf CirculatorySystem
```

Profiles

- **OWL 2 defines three different tractable profiles:**
  - **EL**: polynomial time reasoning for schema and data
    - Useful for ontologies with large conceptual part
  - **QL**: fast (logspace) query answering using RDBMs via SQL
    - Useful for large datasets already stored in RDBs
  - **RL**: fast (polynomial) query answering using rule-extended DBs
    - Useful for large datasets stored as RDF triples

Concluding Remarks

- The more identifiers are used, the better links will be made available among data.
- We should provide both machine and human-understandable description when an identifier is dereferenced.
- ISO identifiers provide different identification schemes for works, expressions, and manifestations that can be useful in enhancing the quality of linked data.
